The cytomorphology of major head and neck and minor salivary gland lesions, as observed by examination of cytocentrifuge specimens prepared by cytocentrifugation on a disposable, limited-volume system, is reported. Overall, aspiration cytology (i.e., collection of cells with the needle) has the advantage of increased accuracy. The cytomorphologic features of the major head and neck

lesions are described, with illustrative, representative, microphotographs and diagnoses. It is concluded that aspiration cytology of the head and neck is not an end of the diagnostic process.
