speedfan 3.16 includes the watchdog timer feature, which is very useful to monitor the performance of your pc and save your files/data. watchdog timer can help you monitor the performance of your pc and save your files/data. unlike with some other programs that require you to use a mouse to enter your settings, speedfan requires you to use a touch screen, along with a touch pen, or stylus. however, for those who are new to touch screen, youll be able to quickly learn how to use it. the program is designed to be intuitive, so you won't have to worry about making a mistake. the tutorial is conveniently available in the support section of the program. speedfan will be a familiar program to anyone who has used similar software, as the interface is very similar to most. you have three tabs at the top, and two additional tabs that are used to adjust specific settings. the first tab is the fan speed control. in this tab, you can adjust the fan speed from 0-1000. the lower end will speed up, and the higher it goes, the slower the fan speed is. the default speed for the fan is set to auto, but you can change it to any value from 0-1000. in order to change it, you have to click the triangle in the speed graph. speedfan is a great tool to have on hand if you want to see what your cooling hardware is up to. while not the most powerful application, it is effective and easy to use. the more complex and better-equipped tools will take you even further, but speedfan is all you need to monitor your hardware and keep the temperatures down. like with most applications, speedfan has its pros and cons. speedfan is more of a tool than a diagnostic software, but most people will find that it is a necessary tool to monitor temperatures in their computers. for the most part, speedfan does a good job of keeping the temperatures down in my system, and i was able to identify any changes in operating temperatures after i overclocked my computer. i cant say the same for all computers, but for me, speedfan is a good tool to use.
