We had to hop through a custom Windows 7 preview version of Lightroom 5 to create our review shots, but once we finished, we did a fresh install of the full release. We unlocked the program's new features one function at a time and used those most likely to be of real use to most people. We also tested the program with several sample RAW files to showcase how it works and how well it renders various file types. I've made sure to run tests with each type of RAW file, including some of Fujifilm's "version 2" RAW files. In terms of performance, Lightroom 5 lacked on a couple of fronts. First off, as far as I was concerned, the program ran quite sluggishly when unpacking the RAW file in its normal RAW capture mode. While the speed is improved over Lightroom 4, it still takes considerably longer to work than other photo editors. File export actions were also far too fussy for my taste. For example, imagine a RAW file taken with a Fuji X-Pro 2. It has no dynamic range, but does have RAW+JPEG and RAW+DNG. When I go through Lightroom's file export process, it asks me first what I want the camera to do. I select either just the uncompressed RAW file or a selection of the RAW+JPEG file. When I go to export the file, it forces me to save as a DNG. Now, I know what this is, but in real life, I'd rather export the raw file alone because I don't know if the JPEG is made on site or in-camera or which ISO the photographer chose. It's an extra step, but a simple one. In conclusion, I believe that Lightroom 5 is a solid improvement over Lightroom 4. It's one of the best programs available for handling RAW image files. It's somewhat lacking in performance and when I export a file, it forces the user to do things in a way that they're not used to. I also find that even though it's now fully 64-bit ready, managing large catalogs poses a bit of a problem.
